

Highly Commended

Programming, Apps &
Robotics
Year 7-8

Ricardo Phan

Mount Carmel College

This project aims to amaze people by the beauty of science by sharing the fun from my favourite science channel to other people.

Its main scientific purpose is to make people want to learn more about the immune system inside them and how they work, why it exists and other stuff.

To try this game out, you must have a computer, connected to Wi-Fi and is only available on scratch, a free coding website for everyone, no matter how old they're, what gender they are or their different beliefs, looks, sexuality or nationality.

After you click on the link below, scratch will take a while to load the project. This game appears as a platformer to simulate the insides of the body when things happen, like when there's invaders inside the body, how the civilian cells react, how the cells communicate between each other.

Credits to Kurzgesagt for inspiring me to do this and Irrationalmango for the platform that my game used. They're both on youtube by the way! Kurzgesagt is an amazing science that educate me by telling stories, amazing and great stories. They made the some of the most boring and complex topics in science interesting with fun facts that you'll never forget(even though sometimes), great arts, smooth animations and a calm narrator's voice. Learn more about Kurzgesagt here: <https://www.youtube.com/@kurzgesagt>
